

# Assignment6a

November 20, 2017

## 1 Training a Neural Network with PyTorch (1.0 points)

In this assignment, your task is to train a Neural Network or Multilayered Perceptron (MLP) classifier on synthetic data using PyTorch. We'll start by creating the same network architecture as in last week's assignment, only using PyTorch instead of our own implementation. Before you start, make sure you've installed PyTorch in your conda installation: `conda install pytorch torchvision`

Please read the assignment entirely before you start coding. Most of the code that implements the neural network is provided to you. What you are expected to do is fill in certain missing parts that are required and then train 2 different networks using gradient descent (Details below).

- Question 1
- Question 2
- Question 3
- Question 4

### 1.1 Imports

```
In [1]: import numpy as np
import h5py
import matplotlib.pyplot as plt
from construct_data import construct_data
from numpy.random import RandomState
from numpy import unravel_index

import torch
import torchvision
import torchvision.transforms as transforms

from torch.autograd import Variable
import torch.nn as nn
import torch.nn.functional as F
import torch.optim as optim

import time
```

## 1.2 Data Generation - Visualization

```
In [2]: prng=RandomState(1)
```

```
%matplotlib inline
plt.rcParams['figure.figsize'] = (5.0, 4.0) # set default size of plots
plt.rcParams['image.interpolation'] = 'nearest'
plt.rcParams['image.cmap'] = 'gray'
```

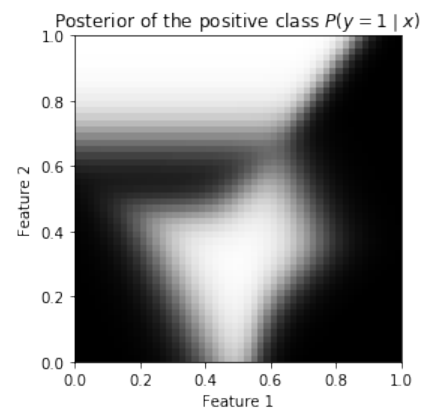

```
%load_ext autoreload
%autoreload 2
```

```
training_features, training_labels, posterior = construct_data(300, 'train', 'nonlinear')
```

```
# Extract features for both classes
features_pos = training_features[training_labels == 1]
features_neg = training_features[training_labels != 1]
```

```
# Display data
fig = plt.figure(figsize=plt.figaspect(0.3))
ax = fig.add_subplot(1, 2, 1)
ax.scatter(features_pos[:, 0], features_pos[:, 1], c="red", label="Positive class")
ax.scatter(features_neg[:, 0], features_neg[:, 1], c="blue", label="Negative class")
ax.axis('equal')
ax.set_title("Training data")
ax.set_xlabel("Feature 1")
ax.set_ylabel("Feature 2")
ax.legend()
```

```
ax = fig.add_subplot(1, 2, 2)
ax.imshow(posterior, extent=[0, 1, 0, 1], origin='lower')
ax.set_title("Posterior of the positive class  $P(y=1 \mid x)$ ")
ax.set_xlabel("Feature 1")
ax.set_ylabel("Feature 2")
plt.show()
```

### 1.3 Generate test set

```
In [3]: test_features, test_labels, _ = construct_data(100, 'test', 'nonlinear' , plusminus=False)
```

### 1.4 Convert data to Torch tensors

All computations in torch are performed on tensors ( generalizations of a matrix that can be indexed in more than 2 dimensions). Therefore we need to first convert our testing and training data to tensors.

```
In [4]: training_features_tensor = torch.FloatTensor(training_features)
        training_labels_tensor = torch.FloatTensor(training_labels)
        test_features_tensor = torch.FloatTensor(test_features)
        test_labels_tensor = torch.FloatTensor(test_labels)
```

Next we'll use the training label and feature tensors to create a TensorDataset as well as a DataLoader that allows us to load batches of our data during each training iteration.

```
In [5]: # loader for training set
        batch_size = 40
        trainset = torch.utils.data.TensorDataset(training_features_tensor, training_labels_tensor)
        trainloader = torch.utils.data.DataLoader(trainset, batch_size=batch_size, shuffle=True,
```

### 1.5 Simple Network in PyTorch

The following cell, demonstrates how to create a very simple network with only one hidden layer with 3 nodes. In the constructor function `__init__()` we create the layers and within function `forward()` we define the structure of the network.

```
In [6]: class SimpleNet(nn.Module):
        def __init__(self):
            super().__init__()
            self.fc1 = nn.Linear(2, 3)
            self.fc2 = nn.Linear(3, 2)

        def forward(self, x):
            x = self.fc1(x)
            x = F.sigmoid(x)
            x = self.fc2(x)
            return x
```

## Train a network with sigmoid non-linearities across all layers

In this assignment we'll create the same neural network we created last week, with [2,10,10,2] nodes (i.e. 2 inputs, 2 layers with 10 nodes and 2 outputs). We'll use sigmoid activations for the hidden layers.

\* Question 1: Use the previous simple network as a guide in order to create the network described. Add the necessary lines inside `__init__` and `forward`.

```

In [7]: class SigmoidNet(nn.Module):
        def __init__(self):
            super().__init__()
            ##### TODO QUESTION 1 #####
            self.fc1 =
            self.fc2 =
            self.fc3 =
            ##### TODO QUESTION 1 #####
        def forward(self, x):
            ##### TODO QUESTION 1 #####

            ##### TODO QUESTION 1 #####
            return x

In [8]: #Next we'll create an instance of our SigmoidNet class
        sigmoid_net = SigmoidNet()

In [9]: # Here we define the learning rate and the number of epochs for our training.
        #Hint: start with a small number of epochs (around 500) to check if everything
        # is working and only then run it for 8000 epochs)
        learning_rate=0.05 #
        epochs = 4000 ## usually has already converged around that number

        ## Here we pick the cost function and the optimizer for our training
        criterion = nn.CrossEntropyLoss()
        optimizer = optim.SGD(sigmoid_net.parameters(), lr=learning_rate, momentum=0.9)

```

## 1.6 Training SigmoidNet

In the next cell the actual training happens. The network is trained for many epochs and for each of the epochs we split our training data into mini batches using the DataLoader that we created previously and iteratively feed them into our network. After each iteration/optimizer step, the parameters are updated in such a way that the loss is minimized.

```

In [10]: start = time.time()

        sigmoid_costs=[]
        sigmoid_accuracies = []

        for epoch in range(epochs): # loop over the dataset multiple times

            running_loss = 0.0
            num_of_batches = 0
            for i, data in enumerate(trainloader, 0):
                # get the inputs
                inputs, labels = data

```

```

    # wrap them in Variable
    inputs, labels = Variable(inputs), Variable(labels)

    # zero the parameter gradients
    optimizer.zero_grad()

    # forward + backward + optimize
    logits = sigmoid_net(inputs)
    loss = criterion(logits, labels.type(torch.LongTensor))

    loss.backward()
    optimizer.step()

    # print statistics
    running_loss += loss.data[0]
    num_of_batches +=1

    # calculate test accuracy
    test_logits = sigmoid_net(Variable(test_features_tensor))
    _, test_predictions = torch.max(test_logits.data, 1)
    correct_predictions = (test_predictions.int() == test_labels_tensor.int()).sum()
    test_length = test_labels_tensor.size()[0]
    accuracy = correct_predictions/test_length
    print('Epoch: %d/%d, loss: %.3f, test accuracy: %.3f'%(epoch + 1, epochs, running_loss/num_of_batches, accuracy))
    sigmoid_costs.append(running_loss/num_of_batches)
    sigmoid_accuracies.append(accuracy)

end = time.time()
duration = end-start
print('Finished Training in %d seconds'%(end-start))

## Train a network with ReLU non-linearities across all layers

In this assignment we'll create the same neural network as previously, but we'll use relu activations for the hidden layers instead. ( Hint: relu activations can be called as `F.relu()` in this notebook and as `torch.nn.functional.relu()` in general. \* Question 2: Add the necessary lines inside `__init__` and `forward`.

```
In [15]: class ReluNet(nn.Module):
        def __init__(self):
            super().__init__()
            ##### TODO QUESTION 2 #####
            self.fc1 =
            self.fc2 =
            self.fc3 =
            ##### TODO QUESTION 2 #####

        def forward(self, x):
            ##### TODO QUESTION 2 #####

            ##### TODO QUESTION 2 #####
            return x

In [16]: #Next we'll create an instance of our ReluNet class
        relu_net = ReluNet()

In [17]: # Here we define the learning rate and the number of epochs for our training.
        learning_rate=0.05 #
        epochs = 1000 ## usually has already converged around that number

        ## Here we pick the cost function and the optimizer for our training
        criterion = nn.CrossEntropyLoss()
        optimizer = optim.SGD(relu_net.parameters(), lr=learning_rate, momentum=0.9)
```

## 1.7 Training ReluNet

In the next cell the actual training happens. The network is trained for many epochs and for each of the epochs we split our training data into mini batches using the `DataLoader` that we created previously and iteratively feed them into our network. After each iteration/optimizer step, the parameters are updated in such a way that the loss is minimized.

```
In [18]: start = time.time()

        relu_costs=[]
        relu_accuracies = []

        for epoch in range(epochs): # loop over the dataset multiple times

            running_loss = 0.0
```

```

num_of_batches = 0
for i, data in enumerate(trainloader, 0):
    # get the inputs
    inputs, labels = data
    # print(inputs.shape)
    # print(labels.shape)

    # wrap them in Variable
    inputs, labels = Variable(inputs), Variable(labels)

    # zero the parameter gradients
    optimizer.zero_grad()

    # forward + backward + optimize
    logits = relu_net(inputs)
    loss = criterion(logits, labels.type(torch.LongTensor))

    loss.backward()
    optimizer.step()

    # print statistics
    running_loss += loss.data[0]
    num_of_batches += 1

    # calculate test accuracy
    test_logits = relu_net(Variable(test_features_tensor))
    _, test_predictions = torch.max(test_logits.data, 1)
    correct_predictions = (test_predictions.int() == test_labels_tensor.int()).sum()
    test_length = test_labels_tensor.size()[0]
    accuracy = correct_predictions/test_length
    print('Epoch: %d/%d, loss: %.3f, test accuracy: %.3f'%(epoch + 1, epochs, running_loss/num_of_batches, accuracy))
    relu_costs.append(running_loss/num_of_batches)
    relu_accuracies.append(accuracy)

# Cross Validation to pick number of nodes for the hidden layers and the weight decay parameter  $\lambda$

In this part we are going to use cross validation to try and find the best values for the number of nodes of the hidden layers as well as for the weight decay. We'll use again relu activations. \* Question 3: Add the necessary lines inside `__init__` and `forward` in order to define a network that can have a variable number of nodes  $N$ . The number of nodes for each layer will be  $[2, N, N, 2]$ . Notice that this time the constructor function `__init__()` has a extra argument  $N$ , that will allow us to specify the number of nodes when creating an object of this class.

```
In [21]: class ReluNetVariableNodes(nn.Module):
    def __init__(self, N):
        super().__init__()
        ##### TODO QUESTION 3 #####
        self.N = N
        self.fc1 =
        self.fc2 =
        self.fc3 =
        ##### TODO QUESTION 3 #####

    def forward(self, x):
        ##### TODO QUESTION 3 #####

        ##### TODO QUESTION 3 #####
        return x
```

The following cell is only conveniently wrapping the whole training procedure inside a function in order to better organize our code. The function returns the best accuracy achieved.

```

```

### Compute the cross-validation accuracy for each parameter combination

Now we are going to again use cross-validation (see assignment 3) in order to find the optimal hyperparameters for our network. However instead of splitting our training set into K-Folds, we'll create a single training/validation split which we'll use for our hyperparameter grid search and therefore the *KFold* class from scikit-learn that we used in assignment 3 won't be necessary here.

Be warned that this part might take about 10 minutes to run. Try it out for less epochs (maybe 100) to check if everything is working and only then run it for more epochs to improve your results.

- Question 4: Fill in the necessary lines in the double loop iterating over the weight decay and number of nodes (parameter grid-search) in order to perform cross-validation. For each combination of hyperparameters, retrain the network calling the function `train_network()` with the right arguments.

```

In [28]: cv_start = time.time()

split_percentage = 0.2
length_training = len(training_labels)
validation_split = np.int(np.ceil(split_percentage*length_training))
random_indices = np.random.permutation(np.arange(length_training))
cv_training_set_features = training_features[random_indices[validation_split:]]
cv_training_set_targets = training_labels[random_indices[validation_split:]]
cv_validation_set_features = training_features[random_indices[:validation_split]]
cv_validation_set_targets = training_labels[random_indices[:validation_split]]
cv_accuracy = np.zeros((len(nodes_range), num_of_lamdass)) # error matrix

learning_rate = 0.05
epochs = 1000

##### TODO QUESTION 4 #####

```

```

## loop hyperparameter num_of_nodes
##   loop hyperparameter lamda (i.e. weight decay)

print('\nCROSS VALIDATION for num_of_nodes = %d and lamda = %f'%(num_of_nodes,

## add the right arguments for function train_network
best_accuracy,_ = train_network( )

# Save the best cv_accuracy for the current combination of parameters
cv_accuracy[i, j] = best_accuracy

##### TODO QUESTION 4 #####
cv_end = time.time()
print('Finished Grid Search in %d seconds'%(cv_end-cv_start))

```

```
